Package 'CanopyPhotosynthesis'

May 23, 2016

Type Package

Title Canopy photosynthesis testbed

Version 1.0

Date 2016-05-04

Author Jin Wu, Shawn Serbin

Maintainer Jin Wu <jinwu@bnl.gov>, Shawn Serbin <sserbin@bnl.gov>

Description Testbed for canopy scaling and modeling of Photosynthesis and GPP

Depends XML

Suggests testthat

R topics documented:

Func_Canopy_Radiation_Transfer
Func_Canopy_Radiation_Transfer

Description

Function for revised DF1997 model to partition canopy LAI into sunlit/shade leaves LAI and partition canopy Vcmax into sunlit/shade leaves Vcmax clumping index was added to original DF1997 model, following the reference from Ryu et al. 2011

Usage

```
Func_Canopy_Radiation_Transfer(FLAG, SZA, LAI, Ib0, Id0, Vcmax0_25, CI)
```

Arguments

FLAG	Model version controller; 0–Lloyd et al. 2010 Model for Vcmax-LAI relationship; 1–Mercado et al. 2006 Model for Vcmax-LAI relationship in the tropics
SZA	solar zenith angle, in degrees
LAI	Canopy leaf area index
Ib0	direct beam at canopy top
Id0	diffuse irradiance at canopy top
Vcmax0_25	Vcmax at reference 25 centi-degree for canopy top leaves
CI	Clumping inedx; 0.63 for tropical evergreen forests (Chen et al, 2005)

Details

Goal: Use revised DF1997 model to partition canopy LAI into sunlit/shade leaves LAI and partition canopy Vcmax into sunlit/shade leaves Vcmax clumping index was added to original DF1997 model, following the reference from Ryu et al. 2011

Value

List containing: PAR0 - ; Ib0 - ; Id0 - ; Lsun - Sunlit LAI; Lshade - Shade LAI; Ic - Canopy total absorbed irradiance; Isun - Sunlit leaf absorbed irradiance; Ishade - Shade leaf absorbed irradiance; Vc - Canopy total Vcmax; Vcsun - Sunlit leaf Vcmax; Vcshade - Shade leaf Vcmax

Func_Leaf_FvCB_Photosynthesis_Model
Func_Leaf_FvCB_Photosynthesis_Model

Description

Leaf level FvCB Photosynthesis model (Farquhar et al. 1980)

Usage

```
Func_Leaf_FvCB_Photosynthesis_Model(Vcmax25, Jmax25, Tleaf, Topt, I, Ci, Press,
  PSII_in, Phi_in)
```

Arguments

Vcmax25	Vcmax at 25 degrees C
Jmax25	Jmax at 25 degrees C
Tleaf	Leaf temperature
Topt	Temperature optimum for Jmax
I	incident light
Ci	internal CO2 concentration in umols/mol or ppm
Press	Atmospheric pressure in Pa
PSII_in	Input PSII for maximum quantum yield
Phi_in	Input curvature factor for light response function

Value

List containing: Anet - Net photosynthetic rate (Agross-Rd,umol/m2/s) at leaf temperature, Agross - Gross photosynthetic rate (umol/m2/s) at leaf temperature, Rd - Leaf respiration rate (umol/m2/s) at leaf temperature, Wc - Rubisco limited photosynthetic rate (umol/m2/s), Wj - RuBP limited photosynthetic rate (umol/m2/s), Wp - TPU limited photosynthetic rate (0.5*Vcmax, umol/m2/s), Vcmax - Maximum rate of RuBP carboxylation (umol/m2/s) at leaf temperature, Jmax - Maximum rate of electron transport (umol/m2/s) at leaf temperature, Vo - , Vomax - Maximum rate of oxygen evolution (umol/m2/s) at leaf temperature, Gamma* - at leaf temperature, Kc - , Ko - , PSII - , Phi - at leaf temperature

Func_Light_Partitioning
Func_Light_Partitioning

Description

Function to partitioning incident radiatoin into direct and diffuse radiation, based on the Weiss and Norman, 1985 light partitioning approach

Usage

```
Func_Light_Partitioning(SZA, P, PAR)
```

Arguments

SZA	solar zenith angle, in degrees
P	Atmospheric Pressure, in pa
PAR	measured total PAR? umol/m2/s

Details

Weiss and Norman, 1985 light partitioning approach

Value

List containing: SZA - solar zenith angle, PAR - PAR, SV - total Visible light, SN - total NIR light, Ratio - the ratio between total measured light and total modeled light, fV - fraction of visble direct beam, fN - fraction of NIR direct beam, Model_DV - direct visible light, Model_dV - diffuse visible light, Model_DN - direct NIR light, Model_dN - diffuse NIR light

Func_Temperature_Bernacchi *Func_Temperature_Bernacchi*

Description

Bernacchi temperature response function for photosynthesis parameters

Usage

```
Func_Temperature_Bernacchi(delta_H, c, Tleaf)
```

Arguments

delta_H	Activation energy
c	Scaling constant
Tleaf	leaf temperature in degrees C

Details

Bernacchi temperature response function for photosynthesis parameters

Value

temperature scale factor

Shawn Serbin

References

Bernacchi et al., 2002

Func_Temperature_June *Func_Temperature_June*

Description

June temperature response function for photosynthesis parameters

Usage

```
Func_Temperature_June(P25, Topt, Tleaf)
```

Arguments

P25	Vcmax/Jmax at 25 degrees C
Topt	Temperature optimum of Vcmax/Jmax
Tleaf	leaf temperature in degrees C

Details

June temperature response function for photosynthesis parameters

Author(s)

Jin Wu

Shawn Serbin

References

Bernacchi et al. 2013 and June et al. 2004

Func_Temperature_Medlyn

Func_Temperature_Medlyn

Description

Medlyn Arrhenius function

Usage

```
Func_Temperature_Medlyn(Tleaf.1, Tleaf.2, Param, Ea)
```

Arguments

Tleaf.1	Original leaf temperature (degrees C)
Tleaf.2	Leaf temperature to scale parameter to (degrees C)
Param	Parameter (e.g. Vcmax, Kc, Gamma*) value at Tleaf.1
Ea	Activation energy for Arrehnius function. Dependent on parameter of interest

Details

Medlyn Arrhenius temperature response function for photosynthesis parameters, based on Bernacchi et al. 2002. Used for Vcmax, Jmax, Rd, Kc, Ko, Gamma*

Value

Parameter scaled to Tleaf.2 following the Arrhenius function in Medlyn et al., 2002

`Func_Temperature_Response`
Func_Temperature_Response

Description

Temperature response functions for scaling leaf-level photosynthesis parameters

Usage

```
Func_Temperature_Response(V25, J25, Tleaf, Topt, Press)
```

Arguments

`J25`	Jmax at 25 degrees C
`Tleaf`	leaf temperature in degrees C
`Topt`	Temperature optimum of Vcmax/Jmax
`Press`	Atmospheric pressure in Pa
`VC25`	Vcmax at 25 degrees C

Details

Temperature response functions for scaling leaf-level photosynthesis parameters

Value

List containing: Vcmax - Vcmax at leaf temperature, Jmax - Jmax at leaf temperature, Gamma_star - Gamma* at leaf temperature, Kc - Kc MM constant at leaf temperature, Ko - Ko MM constant at leaf temperature, PSII - PSII at leaf temperature, Phi - Phi at leaf temperature, Rd - leaf respiration at leaf temperature, Vomax - Vomax (max oxygen evolution) at leaf temperature

`model.options` *parse model.options.xml file used to set parameters and other options for model runs*

Description

Read model.options.xml file

Usage

```
model.options(input.file = NULL)
```

Arguments

`input.file`	model.options.xml file containing information needed for run

Author(s)

Jin Wu, Shawn P. Serbin

Examples

```
## Not run:
opt <- model.options()
model.options <- model.options('/home/$USER/model.options.xml')

## End(Not run)
```
